

L'ART du SON

by
Loricraft Audio

- The liquid comes as a concentrate and makes up to 5 litres with distilled water. The primary function is straightforward - by cleaning your records professionally it assists tracking, minimalizes damage and reduces static effects
- Make sure you have the correct amount of solution before starting cleaning up your records.
- Remember that most of the chemicals are biodegradable, please store the mixture as well as the concentrate in cool and dark conditions.
- Shake well before use!
- The liquid contains no alcohol nor conservation chemicals so it's harmless.
- To clean your records we recommend the following:
With vacuum cleaners: Use a Brush and apply the liquid. The time you give the solution to do the job depends on the condition of the record fair condition: 1 to 2 times of cleaning, allow 2-4 minutes for the solution to work on the surface. Repeat the process once more with a fresh solution. Very dirty records need between 2-4 times of cleaning with the same method. The brush helps to get rid of particles on the records' surface. Machines that create cleaning "bath" for the records like the Knosti do benefit from a second bath with pure distilled water.
- **Terry's cleaning tip:**
Prepare one cup of the concentrate bottle (~2ml) with 100ml demineralized or distilled water (the Loricraft PRC „Spritzbottles“ are ~100ml). Apply the solution on the record's surface and leave it for about 5 minutes to work, than apply suction. Repeat this procedure with a fresh cleaning solution and remove it with your record cleaner. This process guarantees excellent results.
- As the ingredients are biodegradable we strongly advice you to prepare only the amount with distilled water that you intend to use within a few weeks, the mixed solution has a limited shelf life.
- 5 litres will cover ~ 500 records
- For a smaller amount: 1 litre will cover ~ 100 records.
- To make the 1 litre version use the 5th part of the little bottle (= 1,2-1,4 cm height or 18-20 ml volume) to prepare 1 litre of the final cleaning solution Depending on the storage conditions of the mixture it can take 2 to 8 months before biodegradation starts. However we tested the effects and even when the biodegradation started the cleaning property is still very efficient. You can filter the liquid to get rid of the grey particles, this is a sign that the biodegradation has started. Continue using up the liquid within a sensible period.
- During storage the ingredients will separate, small white particles will appear. Just shake the mixture before use.
- The brown glass of the bottle allows safe storage of the concentrate. Carefully read label. Storage in dark and cool conditions is crucial once the solution is mixed. Biodegradable means, that the ingredients will be destroyed by light and bacteria. Therefore the chemicals are not harmful to the environment nor the user.
- Best with vacuum cleaners such as the Loricraft, Moth, Micro, Blue Danube, VPI, Nitty Gritty, Keith Monk's, etc. Do not use their internal tanks to store the cleaning solution. Internal tanks keep residues of used solutions.
- From the start of the development of this new product, we used extensive listening tests in addition to the scientific research.
- It offers a significant sonic improvement to your record collection You will be amazed of the results once your records are cleaned. L' Art du Son product. It sounds less harsh and more open than most of the isopropyl based mixtures The chemical ingredients are produced by an international manufacturer and were tested professionally. The biodegradation ability is functional.

For the sonic boost you always wanted!
